

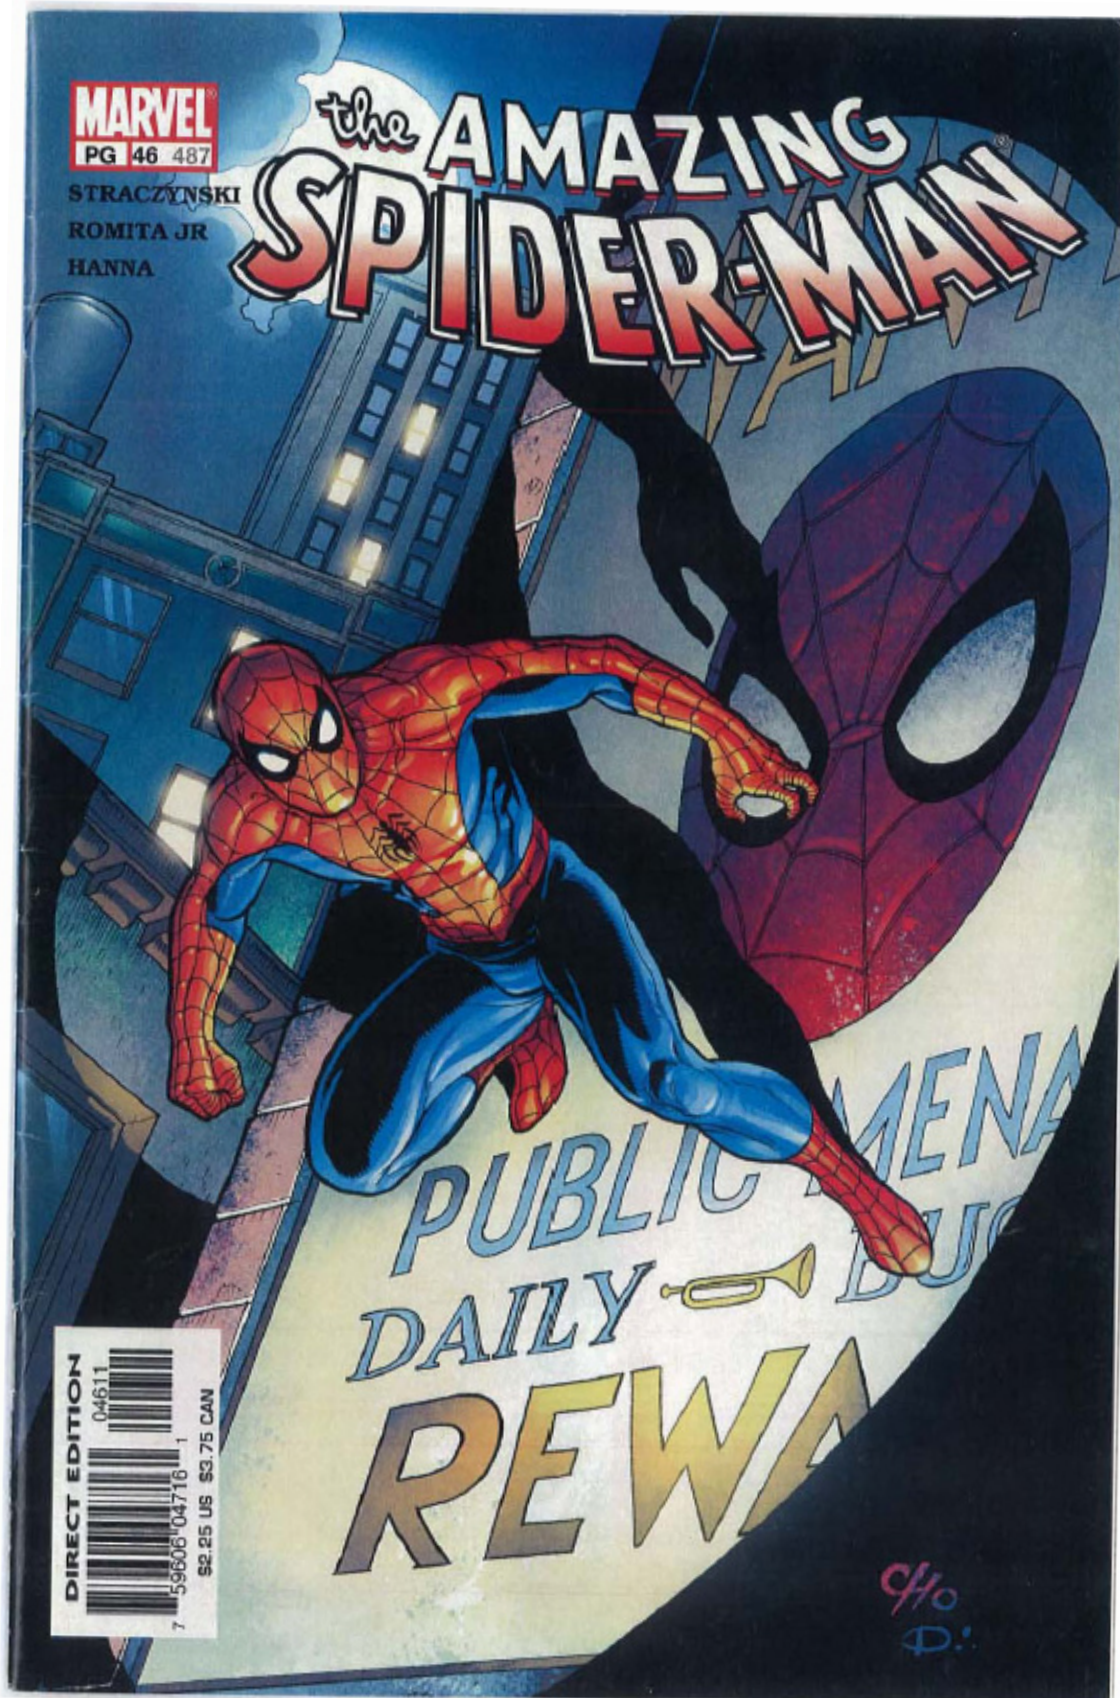

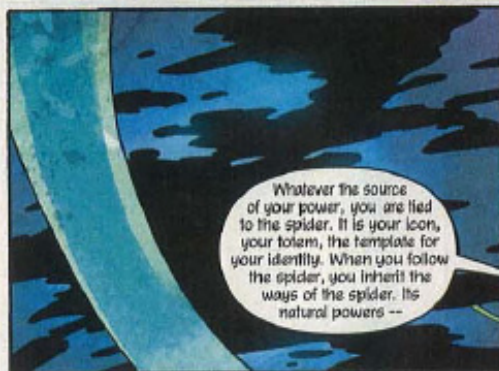

EXHIBIT 42
AMAZING SPIDER-MAN #487 (2002)

The spider wasp is the most efficient spider-killer in the insect kingdom. Its sting quickly subdues its prey by paralyzing the spider's central nervous system. But it does not kill the spider all at once. The spider wasp carries its prey to its nest, or if the spider is too large to carry in flight, the wasp simply drags it to the nest. In order to make the spider easier to drag, some spider wasps bite off the spider's legs, often drinking the blood that leaks from the wounds. The spider wasp places a single spider in each nest, which is often constructed after catching the prey.
